

外籍人才創新創業培訓計畫

The Global Talent Entrepreneurship Program

商業計畫書 **Business Plan**

1. 簡述產品與業務

Product/services

With the spirit of “early response for an early deal at ease”, our team started to initiate ProQuantify from the limitation faced by manufacturing services within the small and medium enterprise (SME) category that has no ability to deliver customer’s requirement quickly although it is now a bare minimum ability to secure a deal while surviving in the industry. We designed an advanced AI-powered solution that will act as the first digital procurement layer to help manufacturing SME achieving rapid growth by service advancement and optimization. ProQuantify will support manufacturing teams to generate Request for Quotation (RFQ), Bill of Quantities (BoQ), for procurement plan just by dropping technical drawings which enable the SME to set their customers requirement and secure the deal earlier without complexities in system integration within the internal infrastructure that may cost high maintenance expense.

Our system is made handy, responsive, and precise. Instead of relying on complex ERP systems or expensive CAD software, our solution enables users to generate accurate quotations directly just by uploading 2D/3D engineering design or images to a mobile messenger robot, a pack of item lists and estimated procurement details will be delivered within minutes. We customize the interface to support both engineers project managers, procurement teams, and business team to decide better while our engines conduct the integration and calculation part independently. Moreover, this solution can also be a powerful solution on the move for sales engineer since day one of subscription. The chatbot will act as a “pocket consultant” in giving process and procurement estimator while understanding customer’s requirement even when securing a deal around the golf or tennis court with clients.

2. 執行團隊

Experienced Executive Team

- **Technical Lead (CTO) : Ahmad Habibulloh**

Carrying demonstrated experience in managing large-scale data pipelines and architecting AI solutions for nation-wide industry scale. Having academic domain in engineering, geospatial analysis, object detection to establish the accurate solutions with efficient engine performance.

- **Industrial and Operations Lead (COO) : Risman Gustiana Wardana**

Possess the intelligent manufacture domain to ensure that each system end-to-end implementation is based on real-case of the targeted customers segment and align to relevant industry standard within ISO/ANS and CAPP principles.

3. 我們在解決什麼問題？

What is Your Solution ?

In a typical manufacturing workflow, the process looks like this:

1. Problem or damage is identified
2. Engineering team redesigns or adjusts the part
3. Quotation (RFQ) is prepared
4. Vendors are contacted
5. Decisions are made
6. Production begins

Among these steps, RFQ preparation is the most critical bottleneck. In many SME, this process is still done manually. Engineers must interpret drawings, estimate materials, calculate costs, and prepare documents without relying on experience rather than standardized systems.

This creates several challenges:

- Quotation takes hours or even days
- Strong dependency on senior engineers
- Inconsistent pricing and decision-making
- Lost opportunities due to slow response

In competitive industries, the reality is simple: The company that responds faster often wins the project.

4. 我們是如何解決問題針對痛點的解決方案是什麼？如何解決？

What pain point are we solving ?

ProQuantify transforms the manufacturing quotation process from a manual, experience-based bottleneck into a structured, data-driven system.

I. Before vs After

- Before: Engineers manually analyze complex drawings; calculations are done in Excel; RFQ preparation takes 3–6 hours.
- After: User uploads a drawing to Telegram; the system analyzes automatically; RFQ, BoQ, and cost estimations are generated in 5–10 minutes.

II. What Customers Receive

Instead of raw data, users receive a Ready-to-Use decision package:

- RFQ Document: A standardized file ready to be sent directly to vendors.
- Bill of Quantities (BoQ): A clear, verified breakdown of materials and quantities.
- Cost Estimation: A structured price point based on current market benchmarks.
- Process Recommendation: Baseline guidance for production (e.g., turning, milling).

III. Unique Advantages

- Telegram-Based Interface: We meet the user where they already work. In a dynamic factory or client environment, opening complex software is impractical. Our mobile-first approach requires zero training.
- Hybrid YOLO-CNN Architecture: We use YOLOv10 for high-speed localization and a Custom CNN for fine-grained classification, ensuring precision that generic AI tools cannot match.
- Zero-Intrusion Security: We address the IP security concerns of SME by acting as a standalone utility. We do not require ERP integration, and data is automatically purged after processing to ensure design privacy.

IV. Core Values for SME

1. Speed: Drastically reduces the time-to-quote for winning manufacturing contracts.
2. Consistency: Standardizes decision-making, ensuring quotes accurate.
3. Independence: Reduces company reliance on a particular officer for every inquiry.
4. Competitiveness: Enables SME to respond more promptly than their digitized competitors.

5. 商業模式

Business model

ProQuantify is a B2B SaaS solution customized for SME manufacturing sector.

I. Revenue Model

- Pay-per-use: For independent contractors (estimated NT\$60–150 per extraction).
- Monthly subscription: for SME with high-volume throughput.

II. Early Traction Strategy

During the mentoring period, our team combining AI/Data background to manufacturing expertise will focus on market validation:

- Pilot Program: Onboard 3 SME manufacturing companies in Taiwan.
- Validation Goals: Generate 15–30 RFQs per month per company to validate market demand and system accuracy with the current condition.
- Resource Plan: We maintain a lean development for the cloud infrastructure to run the feature with minimum capital under NT\$10,000.

III. Entrepreneurial Growth & Market Awareness

This project represents our transition from technical specialists into market-driven founders. We are aware of the dynamic manufacturing market in Southeast Asia and Taiwan, where speed is the only differentiator. By providing a secure solution with a high usability aspect, we enable companies to move from uncertainty to clarity and from experience-based guesswork to data-driven decisions. ProQuantify is beyond just a tool, it is a strategic step toward making small-scale manufacturing faster and more competitive.
